LEVERA · POWERED BY SUN PRODUCTION · PLAIN-ENGLISH GUIDE

The LEVERA website: what's needed before launch

A non-technical explanation of what the website can and can't do today, what has to be added behind the scenes, and what to improve. No coding knowledge needed.

Prepared 28 October 2026 · Based on the current React version of the site and the client's revision brief

01 The short version

- **The website looks and works well.** Both languages, the industry examples, the calculator, the FAQ and the mobile layout all work.
- **One important thing doesn't work yet: the "Send My Hiring Request" form.** When a business owner fills it in, they see a thank-you message, but **nobody at LEVERA receives anything**. The request is lost.
- To fix this, the site needs a small "back office" (called a *backend*). It saves each request, alerts the LEVERA team, emails the client a confirmation in their language, and lets them book a consultation.
- This doesn't need a big, expensive system. It can be built by connecting a few ready-made online services.
- There are also some smaller improvements to make the site faster, easier to find on Google, easier to read, and safer for visitors' personal details.

02 How the website works today

Think of a website as a shop with two parts:

The shop front (frontend)

Everything visitors see and click: text, photos, buttons, the calculator, the language switch. **This part is finished.**

The back office (backend)

Where requests are received, stored and answered. **This part doesn't exist yet.** It's like a shop with a beautiful counter but nobody in the back to take the orders.

Part of the site	Works?	Notes

English / Korean switch	Yes	Each language has its own web address (**/en/** and **/ko/**). The site remembers the visitor's choice.
Industry examples, task menu, before/after slider, calculator, weekly report demo, FAQ	Yes	These are demonstrations, so they don't need a back office.
Mobile phones and tablets	Yes	Tested on phone, tablet and desktop sizes.
Hiring request form	No	It checks the fields are filled in correctly, but the request isn't sent anywhere.
Confirmation email to the client	No	The thank-you screen says an email is on its way, but none is sent yet.
Privacy policy and Terms pages	No	The links exist, but there are no pages behind them yet.
Website address (domain)	To confirm	The final address (for example levera.co) hasn't been confirmed.
Small browser-tab icon (favicon)	Missing	Browser tabs show a blank icon instead of the LEVERA logo.

03 What should happen when someone sends the form

This is the journey the client's brief describes. The back office makes each step happen automatically.

1. **A business owner fills in the form and presses "Send".**
   For example, Sam from Patel Auto Rentals, on the Korean or English page.
2. **The website checks that it's a real person, not a spam robot.**
   This happens invisibly, without annoying puzzles.
3. **The request is saved in LEVERA's client list.**
   It's stored with Sam's language (English or Korean), how Sam found the site, and the status "New inquiry".
4. **The LEVERA team gets an alert straight away.**
   By email, and optionally a chat app like Slack.
5. **Sam sees the thank-you screen and receives a confirmation email in their own language.**
   English: "Thank you for reaching out to LEVERA…" / Korean: "LEVERA 채용 상담 신청이 접수되었습니다…"
6. **Sam books a consultation time using a link.**
   The link appears on the thank-you screen and in the email.
7. **Sam's status changes to "Consultation" automatically, and reminder emails stop.**
   From here, the LEVERA team moves Sam through the recruiting steps by hand.

The recruiting steps the client list should track

New inquiry → Consultation → Needs confirmed → Searching → Screening → Shortlist → Interviews → Hired → Support weeks 1–4 → Closed

04 The pieces the back office needs

Each piece is a ready-made online service. The names in the third column are well-known examples, not the only choices. Many have a free or low-cost starting plan; current prices should be checked when signing up.

Piece	What it does, in plain words	Example services	Priority
Form receiver	A small piece of code that catches each form when it's sent and passes it on to the services below. It's the "post room".	Built by the developer on the website host (e.g. Vercel, Netlify)	Before launch
Client list (CRM)	An online address book and sales board. The team sees every request, its language and its recruiting step.	HubSpot (free plan), Pipedrive, Airtable	Before launch

Automatic emails	Sends the English or Korean confirmation to the client, and an alert to the LEVERA team.	Resend, Postmark, SendGrid	Before launch
Spam protection	Stops robots from flooding the form with fake requests.	Cloudflare Turnstile (invisible to people)	Before launch
Privacy records	Keeps proof that each person agreed to the privacy policy, and lets anyone unsubscribe from marketing emails.	Part of the CRM and the email service	Before launch
Booking calendar	Lets clients pick a consultation time without back-and-forth emails.	Calendly, Cal.com	Soon after
Visitor statistics	Shows how many people visit, where they come from (Google, Instagram, an ad…) and which channels bring requests.	Plausible, Google Analytics	Soon after

What we should NOT build

The client's brief is clear that LEVERA is a recruitment service, not software. So **no** customer login or dashboard, payroll system, monthly subscriptions, time tracker, AI agents, live task feeds or employee management system. The weekly report and calculator on the site are just illustrations.

05 Improvements to the website itself

These are separate from the back office. Each item explains why it matters for LEVERA.

Speed: the site should open quickly, especially on phones

What we found	Why it matters, and the fix	Priority
The six small round industry pictures in the top section are full-size photos shrunk down. Together they're about 400 KB, over 20 times more than needed.	Slower first impression, especially on mobile data. **Fix:** make small thumbnail versions.	High
English visitors also download the Korean font information.	Wasted loading time. **Fix:** only load Korean fonts on the Korean pages.	Medium
The large faded logo in the footer and the decorative symbol behind the form are heavy image files.	Extra loading for decoration. **Fix:** use lightweight versions of these graphics.	Medium
Photos lower down the page load immediately, even before the visitor scrolls to them.	**Fix:** load them only when the visitor scrolls near them.	Low

Being found on Google and looking good when shared

What we found	Why it matters, and the fix	Priority
The page content is built in the visitor's browser, so search engines may see an almost empty page at first.	Google may rank the site lower. **Fix:** the developer can "pre-build" each language page so the text is there from the start.	High
No preview picture or summary is set for when the link is shared on WhatsApp, KakaoTalk, LinkedIn and similar apps.	Shared links look plain and get fewer clicks. **Fix:** add a share image and text in each language.	Medium
No site map for Google, and no FAQ information marked up for search results.	**Fix:** add both, so Google understands the site and can show FAQ answers in results.	Medium
Missing logo icon in browser tabs.	Looks unfinished. **Fix:** add the LEVERA symbol as the tab icon.	Medium

Easy to read for everyone

What we found	Why it matters, and the fix	Priority

The small light-grey text (fine print, labels, captions) is a little too faint.	Hard to read for older visitors or in bright sunlight, and below the common accessibility standard. **Fix:** make that grey slightly darker. It's a tiny visual change.	Medium

Privacy and safety

What we found	Why it matters, and the fix	Priority
While someone types in the form, the website saves their name, email and phone on that computer, so nothing is lost if they leave. **This saved copy is never deleted, even after sending.**	On a shared or office computer, the next person could see those details. **Fix:** delete the saved copy after sending, and don't keep email or phone at all.	High
Basic security settings on the web host aren't set yet.	**Fix:** the developer turns on standard protections (secure HTTPS connection, etc.) when the site goes live.	High

Housekeeping

- Two photos are no longer used after the redesign, plus a backup copy of the old one-page site. They can be deleted once the client approves the new version.
- Keep the automatic checks we used during the redesign (for the form, buttons and language switch), so the developer can rerun them before every update.

06 Decisions and information needed from the client

The back office can't be finished until these are answered. You can use this as a checklist.

- [ ] **The final website address (domain)** and who has access to its settings
  For example levera.co. Needed for the site and for emails not to land in spam.
- [ ] **The email address that receives new requests**, and confirmation that hello@levera.co is real
  Should the team also get alerts in Slack or another chat app?
- [ ] **Which client list (CRM) to use**
  Or approve the suggestion: HubSpot's free plan.
- [ ] **Which booking calendar to use**, and whose calendar it connects to
  Calendly or Cal.com.
- [ ] **Privacy policy and Terms text, in English and Korean**
  Ideally reviewed by a lawyer. The brief also asks for legal review of recruiting rules and contracts before launch.
- [ ] **Approval of the confirmation email wording**, in both languages, and the sender name
  For example "LEVERA Team".
- [ ] **Whether to track visitor statistics**, and if so, whether a cookie consent banner is needed
- [ ] **A native Korean speaker's review** of all Korean text on the site and in emails
- [ ] **Permission to mention the ~280-vehicle rental customer** as a reference, if wanted

07 Suggested plan

Time estimates are rough and assume the client's decisions above are made quickly. They don't include lawyer review or writing the legal pages.

PHASE 1

Ready to launch

Form works end to end, client list, confirmation emails in both languages, team alerts, spam protection, privacy records, legal pages, logo tab icon, final address, security settings.

About 4–6 days of developer work

PHASE 2

Fast and easy to find

Smaller pictures, faster fonts, pre-built pages for Google, share previews, site map, easier-to-read grey text.

About 2–4 days of developer work

PHASE 3

Measure and automate

Visitor statistics, reports on which channels bring clients, booking calendar connected so reminders stop automatically.

About 2–3 days of developer work

Useful questions to ask the developer you hire

- "Will the client list, emails and booking all be on services LEVERA owns the accounts for?" (They should be.)
- "Can I see a test request go all the way through, in both English and Korean, before launch?"
- "What happens if the email service is down? Is the request still saved?"
- "How do we delete someone's details if they ask us to?"
- "What will this cost per month at our expected number of requests?"

08 Glossary

Term	Meaning
Frontend	The part of the website visitors see and click.
Backend	The behind-the-scenes part that receives, stores and sends information.
CRM	"Customer relationship management": an online client list that tracks each person and where they are in the process.
Domain	The website's address, like levera.co.
Host / hosting	The company whose computers keep the website online, like a landlord for the site.
Serverless function	A small piece of code the host runs only when needed, such as when a form is sent. There's no server to look after.
Spam / bot	Fake form submissions sent automatically by computer programs.
Transactional email	An automatic, one-to-one email triggered by an action, like "we received your request". It's different from a newsletter.
Favicon	The tiny logo shown in the browser tab.
SEO	"Search engine optimisation": making the site easy for Google to understand and show in results.
Accessibility	Making the site usable for everyone, including people with poor eyesight or who use a keyboard instead of a mouse.
Cookie consent banner	The pop-up asking visitors to accept tracking. Needed in some countries if certain statistics tools are used.
HTTPS	A secure connection: the padlock in the browser's address bar.

The goal from the brief: the visitor understands, "You tell LEVERA what your business needs. We find, vet, and introduce the right person. You hire directly. We support the first four weeks." Everything in this guide supports that, without adding software LEVERA doesn't sell.

A more technical version of this plan, for the developer, is in the project folder: LEVERA_Backend_and_Optimization_Plan.pdf.
